RADISSON ACQUIRES 4 ADDITIONAL GOLD-MOLYBDENUM PROPERTIES IN NORTHWESTERN ONTARIO

Rouyn-Noranda, Quebec, Canada, December 28, 2005 – Radisson Mining Resources Inc. (TSX-V:RDS) is pleased to announce that the Company has acquired four additional gold-molybdenum properties in the area of its Dryden molybdenum showing, announced November 4th. These acquisitions are in an area of historical gold and molybdenum occurrences, located approximately 100 km south of Dryden, Ontario.

Radisson has staked eleven claims (84 claim units) of prospective ground west of Vickers Lake, and centered on the area of the historical Grave Lake molybdenum occurrence. These claims host the Grave Lake occurrence, as well as two other known molybdenum showings. This newly staked property is located immediately west of the Smooth Rock occurrence, located on the west shore of Vickers Lake. Two additional claims (32 claim units) were also staked over a mineralized gabbro unit associated with the Grave Lake showing, making a total of thirteen claims for the property.

Further research into the molybdenum potential of the area also resulted in the staking of two additional properties, located in the Harper Lake and Olsen Bay areas around Manitou Lake to the north. These properties consist of one claim (12 claim units) at Harper Lake and 5 claims (50 claim units) at Olsen Bay.

Acquisition of the fourth property is by way of an option agreement with the owners of two claims that are contiguous with Radisson's Grave Lake claim group. Previous exploration programs indicate that the property hosts both gold and molybdenum mineralization, with two separate zones of gold mineralization being outlined (the Smooth Rock Lake Occurrence and the Angove Showing) near the west shore of Vickers Lake.

Historical works on the Smooth Rock Lake Occurrence include the following results:

- grab samples reported from the area (OGS Report 282, 1993) returned up to 2.2 oz/ton gold
- vein assays 0.611 oz/ton and 0.514 oz/ton gold across 2.5 ft in the pit and 0.111 oz/ton and 0.288 oz/ton gold across 8 ft in the outcrop face 23 ft north of the pit (Northair Mines report, 1989).
- Hole VL-84-1 – 2.5 ft of 0.406 oz/ton gold, with minor molybdenite (Northair Mines report, 1989).
- East wall of pit – 1.08 oz/ton gold across 0.5 ft (Northair Mines report, 1989).
- 8 ft east of the east wall of the pit – 2.24 oz/ton gold across 0.7 ft (Northair Mines Report, 1989)
- Composite of grab samples over 25 ft of strike of main vein – 0.386 oz/ton gold (Northair Mines report, 1989).

The Angove Showing, located southwest of the Smooth Rock Occurrence has reportedly returned a sample of 0.21 oz/ton gold from quartz vein float, with associated pyrite, chalcopyrite, and shearing.

Radisson has entered into a three-year option agreement with the owners (a group of four prospectors) for the two claims (ten claim units). Terms of the agreement provide for a payment schedule over the next three years of \$68,000 cash and the issuance of 50,000 share of the company over the period. The agreement is subject to a 2% Net Smelter Return retained by the vendor.

Acquisition of these four properties will allow the Company to better institute a regional exploration program, for both gold and molybdenum, as part of their overall exploration strategy in northwestern Ontario. By initiating this venture, Radisson management is becoming strategically diversified in order to enhance shareholder value by identifying a new commodity – molybdenum – as a valuable target. Radisson is also diversifying geographically by becoming involved in the prolific untested mineral belts of the Precambrian Shield in Western Ontario.

Radisson is a Quebec-based mining exploration company, focusing on the discovery of gold, molybdenum and base metal deposits. It is the sole owner or has interests in fourteen properties, located in northern Quebec (9) and northwestern Ontario (5). The most advanced property and also the company's principal asset is the former O'Brien Mine property in Cadillac, Quebec. This mine produced 587,521 ounces of gold (1926 – 1956) from 1.3 million short tons at an average grade of 0.467 ounces gold per short ton. The company also owns a gold mill, rated at 200 tons per day, on the O'Brien property.
